Restoration of the Endodontically Treated Tooth

This book serves as a clinical guide to help the practitioner improve endodontic treatment outcomes. It focuses on the various factors affecting the prognosis of endodontic treatments and on their impact on short-term and long-term results. The text incorporates up-to-date knowledge, techniques and treatment protocols. Each chapter has been carefully chosen to address either foundational knowledge or a select aspect of endodontic treatment. The authors analyze the knowledge accumulated from a large number of outcome studies and provide the reader with a critical appraisal indicating the strengths and weaknesses of those studies. This information is then used to make recommendations on how to predict the outcome of the intended treatment. The authors emphasize that the endodontic prognosis is a multifactorial phenomenon, underscoring how various factors, singularly and in combination, influence the treatment outcome. Readers are provided with tools to successfully assess the prognosis of the proposed treatment at the outset and to execute the planned treatment focused on optimal outcome.

Contemporary Fixed Prosthodontics

This book is a state of the art clinical guide to contemporary materials and techniques for the restoration of individual teeth and implants. It fully reflects the important developments in the field over the past 15 years, including in particular the shift away from wholesale use of crowns towards adhesive dentistry and less invasive extra-coronal restorations. The book opens by considering the principles and evidence base relating to the longevity of restorations of teeth and implants. Importantly, it explains how to ensure “a healthy start” and manage future risks. Material choice and aesthetic issues are then discussed, before all aspects of the planning and provision of extra-coronal restorations are examined in depth. The coverage also includes the adaptation of crowns to existing partial dentures. In line with modern dental education, each chapter begins with clinically relevant learning objectives, and helpful clinical tips are highlighted. The book will be of value for senior dental undergraduates, postgraduates, and practicing dentists and its scientific content will be of interest to dental academics.

Color Atlas of Endodontics Restoration of an endodontically treated tooth, because of the significant loss of tooth structure, often requires additional support from the root canal by means of a post-and core restoration. However, post may generate stresses which lead to vertical root fracture and loss of the tooth. Since post design, material used and the post space preparation has a significant influence on vertical fracture prevalence, broad investigation is in progress to find out the optimum procedure. Esthetic, functional and structural rehabilitation of a pulless tooth are critically important to ensure a successful restorative outcome. In cases where most of the coronal portion is lost, a common method to restore such teeth is the use of a post and core, onto which a full crown is cemented. The post functions primarily to aid the retention of the restoration and to protect the tooth by dissipating or distributing forces along the tooth. On the contrary, the tooth is weakened if dentin is sacrificed to place a large diameter dowel. The main purpose of this study was to evaluate the ability of different types of posts to reinforce endodontically treated teeth.

The Principles of Endodontics Coronal microleakage as a source of contamination has been cited as one of the major significant causes of endodontic failure, and great emphasis is placed on the quality of the definitive restoration after endodontic therapy. The coronal restoration should provide a perfect seal to prevent ingress into the access cavity and ultimately the root restoration. Dental amalgam has been used successfully for more than 170 years as a restorative material. This book gives an insight between conventional and bonded amalgam restorations in endodontically treated teeth. The book shall be helpful in convincing the fact that bonding amalgam not only has multipurpose advantages but more importantly provides a perfect coronal hermetic seal and therefore preventing failure of root canal therapy.

The Restoration of the Endodontically Treated Tooth Endodontic treatment saves the tooth from extraction but only adequate restoration will reinstate it as a long-term functioning member of
the mouth. The restoration of a tooth by root canal treatment is of limited value unless the crown of tooth is satisfactorily restored. The manner in which a root canal filled tooth is restored is therefore considerable importance. The restoration of endodontically treated tooth is complicated by the fact that much or all of the coronal tooth structure which normally would be used in the retention of the restoration has been destroyed by caries, previous restorations, trauma, and the endodontic access preparation itself. The endodontically treated tooth is a unique subset of teeth requiring restoration because of several factors such as dehydrated dentin, decreased, decreased structural integrity and impaired neurosensory feed back mechanism when compared to a vital tooth. However, the treatment goal must be based upon a multitude of factors specific for each patient, so that the strategic architectural aspects that have/greatest impact on the ultimate strength of the pulpless tooth can be restored/reinforced.

Restoration of Root Canal-Treated Teeth When performed under the proper indications, autotransplantation of teeth is a predictable technique that usually results in a good prognosis. This clinical atlas details the various procedures involved in autotransplantation. Readers are introduced to concepts such as wound healing associated with autotransplantation, clinical indications, surgical procedures, and prognoses for various situations, and they can see the outcome of specific cases over extended periods of time. The book should be a useful resource for oral surgeons, orthodontists, and pedodontists wanting to integrate this procedure into their practice.

Optimizing the Restoration of Posterior Endodontically Treated Teeth
When faced with the challenge of restoring an endodontically treated
tooth, the dentist must decide, first, whether the post is required and second, the type of restoration that is indicated. Earlier a post was thought to strengthen the root of an endodontically treated tooth. But it is widely held today that the primary purpose of post placement is to retain the core buildup material or to reinforce the remaining coronal tooth structure. It is difficult to discuss the longevity of teeth restored by a post because there are many variables to control. The long term clinical success of an endodontically treated tooth is dependent on many factors. The successful treatment of a badly broken down tooth with pulpal disease depends not only on good endodontic therapy, but also on good prosthetic reconstruction of the tooth after endodontic therapy is completed. The decision to place a post is based on several parameters. These include the position of the tooth in the arch, occlusion, function of the restored tooth, amount of remaining tooth structure and canal configuration.

Restoration of Endodontically Treated Teeth
This book provides dental professionals with a clear understanding of current clinical and scientific knowledge on the various aspects of pulp treatment for both primary and young permanent teeth. Diagnostic parameters are clearly presented, along with step-by-step descriptions of clinical procedures, including indirect and direct pulp treatments, pulpotomy, and pulpectomy. The rationale for the materials used in each technique and their individual merits and disadvantages are examined in detail. In the case of pulpotomy, all the materials used since the introduction of this treatment modality are discussed (e.g., formocresol, glutaraldehyde, ferric sulfate, and MTA) and the roles of sodium hypochlorite, electrofulguration, and laser therapy are elucidated. Special attention is devoted to pulpectomy and root canal treatment, with consideration of debriding and obturation techniques, rinsing solutions, and root-filling pastes. A further individual chapter is dedicated to restorations of teeth treated.
with the different types of pulp therapy. The various conservative treatment modalities are also presented, including specific treatments for immature nonvital permanent teeth. The concluding chapter looks to the future and the potential value of stem cells in pulp therapy.

Restoration of Endodontically Treated Teeth

The choice of dental restoration depends on the amount of remaining tooth, which may influence long term survival and cost. For endodontically treated teeth, it is believed that coronal coverage can improve the clinical success of the restored teeth. An endodontic post is a partial prosthesis that is fixed inside the root canal. They are used to retain the coronal restoration when considerable tooth structure is missing. A core is a built-up structure that compensates for the lost tooth structure. It can either be part of the post material or a different material that is attached or bonded to the intra-canal post. Composite restoration material is widely acceptable build-up material for this purpose. In the perspective of publicly funded health insurance plans, it is important to base the coverage of dental crowns for vital and non-vital teeth on the best available evidence. It is of particular interest these plans to define evidence-based criteria for the coverage of crowns for vital teeth, and for the coverage of using posts/cores and crowns on endodontically treated teeth. In Canada, such evaluation is complicated by the fact that publicly funded health insurance plans do not have control over the care provider's choice of the crown type, and by the fact that there can be one fee code designated for all types of porcelain crowns, such as within the Ontario Ministry of Community and Social Services. The objective of this review is to evaluate the clinical and cost-effectiveness of dental crowns for vital teeth and the use of post-core-crown restorations for endodontically treated teeth.
